## **ENRGYENV 491 – Modeling and Analysis for Environmental Sustainability** Fuqua School of Business

In 1987, the World Commission in the Environment and Development, also known as the "Brundtland Commission," defined sustainable development as "…development that meets the needs of the present without compromising the ability of future generations to meet their own needs." Although there are many ways in which this basic statement has been elaborated, it remains the fundamental concept underlying the entire sustainability movement among firms, governments, NGOs, and individuals today.

Many firms are beginning to look for ways to do business in a more sustainable way, whether that means reducing their use of fossil fuels for energy, extracting resources in a way that does not threaten the future supply of those resources, or finding ways to manage their waste streams to reduce pollution and even to capture value from what is currently discarded. Governments are struggling with carbon policies, and firms are beginning to request regulation in an effort to resolve the current uncertainty about what those regulations will look like. NGOs are involved in sustainability efforts around the globe, partnering with governments and firms, and in many cases providing vehicles for stakeholders to get involved in the push toward sustainable economic development.

In this course, we will look at tools that businesses can use to measure, evaluate, and manage their sustainability. The course has three parts, each one corresponding to about two weeks in our six-week schedule. We learn how to calculate a greenhouse gas inventory and the tools that are needed to do this. We will find out that companies are facing new risks, and we will learn how to evaluate those risks. Finally, we will see how managers can use the tools they have to develop and evaluate different alternatives – including the use of emissions allowances and offsets – as they decide how to incorporate sustainability in the firm's strategy.

Class times: Class meets Monday-Thursday 4:00-6:15

**Location:** The Connally Classroom at Fuqua. Non-Fuqua students: You can download a map at <a href="http://www.fuqua.duke.edu/documents/programs/campus\_map.pdf">http://www.fuqua.duke.edu/documents/programs/campus\_map.pdf</a>

Instructor: Bob Clemen Office: Academic Center W319 Phone: 660-8005 E-mail: clemen@duke.edu

**Office hours:** Most afternoons, except Wednesday. Please call first if. If you can't call, drop by anyway. Usually I can give you the time you need, when you need it.

**Contacting me:** Phone calls and emails both work well. Please use email for straightforward questions that only need a short (a sentence or two) answer. Please call or come to my office if we will need to have a conversation. If you've sent me an email asking a question but haven't heard back for a while, please follow up with a phone call.

Where should you call? Try the office first (919-660-8005) and then my cell phone (919-451-4073). If you leave a message, please include a number where I can reach you. I work at home a lot, and I don't mind you calling me on my cell there. During the day, evenings, and weekends are all OK. Please don't call before 9:00AM or after 9:00PM.

About email: I will do my best to stay current with email. However, there are two limitations. First, my time is limited during the afternoons when I am teaching. Second, my last email check in the evening may be around 9:30 or 10:00. After 9:00 PM I may only answer quick questions.

**Course web site:** <u>http://faculty.fuqua.duke.edu/courses/decision491sustainability/</u> You will find what you need, like this syllabus, assignments, links to our electronic library reserves, and more.

**Grades:** Your grade will be determined by your performance on three graded cases (completed in teams), individual assignments, a term project, and participation:

Cases	30%
Individual assignments	30%
Term project	30%
Participation	10%

Some details about the assignments:

- **Individual assignments.** You will complete four individual assignments. These will require you to apply to tools we have studied, and you might have to locate and use information on the Internet in order to complete the calculations or answer the questions. You may hand in hard copy or send them to me by email. Individual assignments will be due by 5:00 PM on Friday.
- **Team assignments.** You will have two team assignments to complete. These are case studies and will require you to assemble a report showing your analysis, arguments, insights, and conclusions. I will provide details about my expectations with each assignment. The teams will consist of two people, and I will assign the teams.
- **Term project.** The term project will get you thinking about and applying the tools we study to a specific company. Please see details below.
- **Participation**. I expect everyone to contribute to our class discussions throughout the term. I do intend to cold-call a few people each day at random to answer questions about the readings.

# **Readings:**

- The **coursepack** contains the cases we will cover; plan to purchase a copy.
- Our **electronic reserves** site (<u>http://library.fuqua.duke.edu/reserves.htm</u>, accessible through the course website) will have articles and book chapters.
- Our **course website** (<u>http://faculty.fuqua.duke.edu/courses/decision491sustainability/</u>) has links to many additional resources.

**Expectations:** I've changed this course radically based on student feedback last year, so there are two things that are critical for you to understand:

• **My expectations:** It is very important that you understand what I value most in my students: initiative and thinking that is creative, independent, and critical. This is true in all of my courses, but especially here. There are many directions one can take to study tools for environmental sustainability. Although I have put together a course that I believe makes good sense, you are encouraged to take initiative in learning about other

aspects of sustainability management and bringing what you learn to my attention and to that of the class.

• Your expectations: Because many of the assignments and lectures are new, please do not expect everything to be perfect. I will do my best to provide you with everything you need – assignments, readings, exercises, Powerpoint slides – but please realize that many will be first drafts, and they may be rough. By the same token, I will be more than willing to consider refinements to virtually any aspect of the course as we make our way through the term.

**Fuqua Honor Code:** All aspects of the Fuqua Honor Code apply. Perhaps most important for this class is that all work you hand in must be your own, or it must be properly attributed. It is a serious honor code violation to "copy and paste" material from other sources into your own document without indicating the source. (This doesn't mean you cannot quote material you get from articles, books, or the web. You just have to indicate the source.)

Read the full Fuqua Honor Code at <a href="http://www.fuqua.duke.edu/about/honorcode/index.html">http://www.fuqua.duke.edu/about/honorcode/index.html</a>

# A few additional notes:

- **Computers in class:** Laptops are welcome in class. In particular, we may have many opportunities to refine and re-run computer models or to locate information online.
- Missing classes: Please let me know in advance if you have to miss class.
- **Starting on time:** I will start on time at the beginning of class and after the break. If you do come in late, I will try to quell a demonic urge to cold-call you before you sit down. In the past I've had some limited success in doing that. ;-)

# **IMPORTANT ACTION ITEMS**

- 1. Do the preassignment. See below for details.
- 2. Read through the description of the term project below, and start thinking about companies you might like to analyze.
- 3. Read through the course schedule to get an idea of what we will cover.
- 4. Familiarize yourself with the course website and our electronic reserves (links above).
- 5. Please bring any questions you have to the first day of class.

## **Course Schedule**

Session - date	Topics
1 – Mar 16	Introduction and course overview. Introduction to greenhouse gas inventory
2 – Mar 19	Corporate GHG inventories. Guest speaker: Tavey Capps. Duke Sustainability Coordinator. GHG inventory at Duke. Exercise 1 on GHG inventories due Friday, March 20
3 – Mar 23	Life cycle assessment (LCA), a brief introduction
4 – Mar 26	Toxic substances and pollution. Guest speaker: Mike Colarossi, Akzo Nobel Exercise 2 on LCA due Friday, March 27
5 – Mar 30	Eco-labels and certification programs. Introduction to risk assessment for sustainability
6 – Apr 2	Guest speaker: Dan Vermeer. Drowning in risk: Water in Coca Cola's value chain.
7 – Apr 6	Team assignment #1 due: Walmart Sustainability Strategy Guest speaker: Michelle Harvey, Environmental Defense Fund
8 – Apr 9	Guest speaker: Mike Colarossi, Akzo Nobel Risk assessment examples: Climate risk at Yucca Mountain. Exercise 3 on risk assessment due Friday, April 10
9 – Apr 13	Finishing Risk analysis: The Duke Coal Pile Evaluation and decision making: abatement curves, wedge analysis, and economics
10 – Apr 16	More on abatement curves. Optimization tools for environmental sustainability <i>Exercise 1 on economic analysis and decision making due Friday, April 17</i>
11 – Apr 20	Real options and risk analysis. Introduction to offsets and carbon trading.
12 – Apr 23	Team assignment #2 due: c-Energy's Red Hill Plant Earth day! Case discussion and course wrap-up
Apr 29, 5:00 PM	Deadline for submitting term projects

#### **DECISION 491 -- Decision Tools for Environmental Sustainability**

Fuqua School of Business Duke University Spring Term 2, 2009

## Term Project: Company Sustainability Analysis

Select a company that has produced a recent sustainability report (or for which you can get or reasonably infer information about GHG emissions and other footprint issues). With a partner, you will analyze this company using the tools that we study in the course. Following the general pattern of the course, your report should have three parts:

- Company footprint assessment. What are the main footprint issues that this company faces? Does their sustainability report adequately represent these issues?
- Sustainability risk assessment. What are the primary risks that the company faces? Think about how you might use one or more of the risk-assessment tools we have studied to characterize the company's risks.
- Analysis of alternatives. What do you see as the company's alternatives? How can they address their risks in an economically sound way?

Deliverables:

- Milestone reports. These are one page maximum, bullet points plus brief explanation of how you have or intend to address this part of the project:
  - March 27. Company footprint assessment.
  - April 10. Sustainability risk assessment.
  - o April 23. Analysis of alternatives.
- April 29. Comprehensive write-up. You should have a main text that summarizes your findings (10-20 pages, double-spaced, including graphics as needed), supplemented by relevant supporting documents included as appendices.

See the Global Reporting Initiative website for a list of companies that have filed sustainability reports. <u>http://www.globalreporting.org/GRIReports/GRIReportsList/</u>

#### **DECISION 491 -- Decision Tools for Environmental Sustainability**

Fuqua School of Business Duke University Spring Term 2, 2009

#### Preassignment

#### 1. Readings:

- Read the attached article from Harvard Business Review, "Forethought: Business Climate/Climate Business. This article covers at a very high level most of the climate-related sustainability issues that companies face.
- Read Chapters 1-4 of the Greenhouse Gas Protocol (attached). This will lead you through the initial steps of performing a GHG inventory, our first main topic in the course.
- Read the attached article "Corporate Greenhouse Gas Emissions Management: The State of Play." This gives an idea of what corporations primarily in Europe are doing about GHG emission measurement and management.
- Optional: Read the Intergovernmental Panel on Climate Change (IPCC) Synthesis report "Summary for Policymakers." This is an overview of the entire 2007 IPCC report. You have probably seen bits and pieces of this report. It is worthwhile reading the whole thing. Website: <u>http://www.ipcc.ch/ipccreports/ar4-syr.htm</u>. Click on "SPM."
- 2. You have probably calculated your GHG footprint, but I'd like to have you do so again. The reason should become obvious! Calculate your personal GHG emissions using at least four different calculators. Try to find calculators that include roughly the same items. You should get different results from different calculators. Why? Which one(s) do you have the most faith in?

Be ready to report your results in our first class.

Here are several websites, and you can easily find more online:

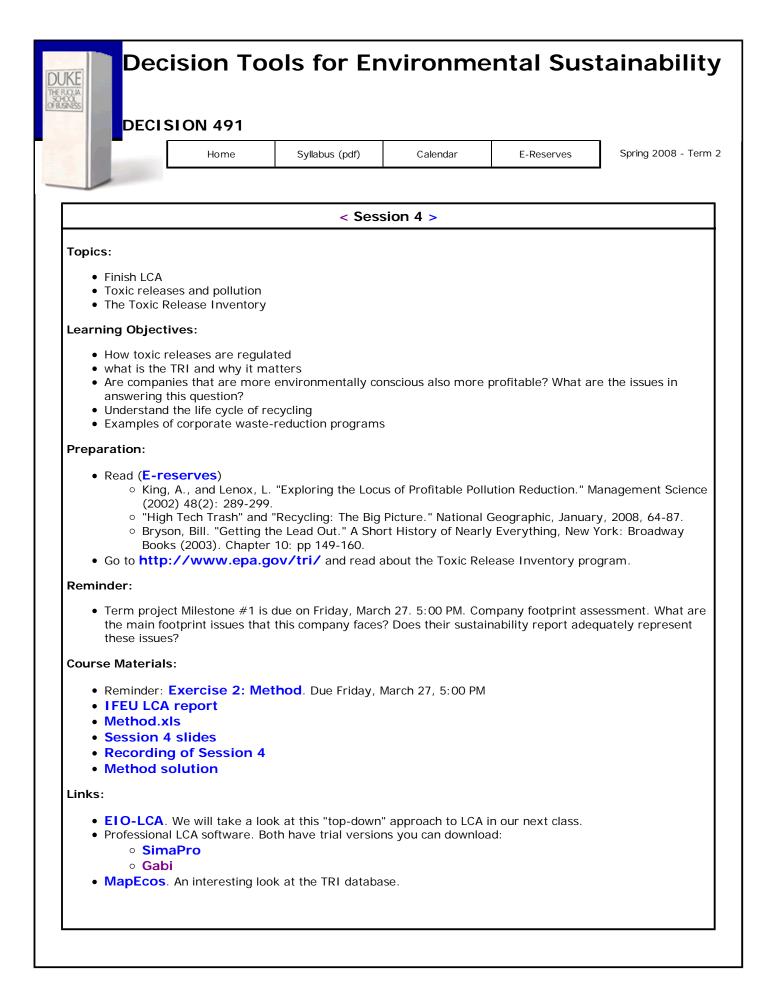

- EPA: <u>www.epa.gov/climatechange/emissions/ind\_calculator.html</u>
- EPA's Excel version, particularly useful because it explains exactly what it is calculating: <u>www.epa.gov/climatechange/emissions/downloads/GHGCalculator\_11-06.xls</u>).
- WRI/SafeClimate: <u>http://www.safeclimate.net/calculator/</u>
- ICLEI: <u>http://www3.iclei.org/co2/co2calc.htm</u>
- Climate Trust: <u>http://www.carboncounter.org/offset-your-emissions/personal-calculator.aspx</u>
- AOL: <u>http://reference.aol.com/planet-earth/global-warming/calculator</u>
- Nature Conservancy: <u>http://www.nature.org/initiatives/climatechange/calculator/?src=f1</u>
- Terrapass: http://www.terrapass.com/carbon-footprint-calculator/#road
- An Inconvenient Truth: http://www.climatecrisis.net/takeaction/carboncalculator/
- Carbonify.com: <u>http://www.carbonify.com/carbon-calculator.htm</u>
- 3. The following websites will be very useful for us during the term. Please visit them and become familiar with them:
  - Environmental Protection Agency (EPA): <u>http://www.epa.gov/</u>
  - Energy Information Administration (EIA): <u>http://www.eia.doe.gov/</u>
  - GHG Protocol: <u>http://www.ghgprotocol.org/</u>
  - Global Reporting Initiative (GRI): <u>http://www.globalreporting.org/Home</u>
- 4. Complete the problems on the next page. You may have solved problems like this before (in which case these should be easy!). These will not be graded, and I will not collect them. The reason I am asking you to solve these problems is so that you will be able to perform basic calculations with emission factors and units of energy. A solution will be available after our first class.

home-laundered cloth, commercial service, and disposable. Moreover, it concludes that the overall impact of diapering a child for 2.5 years is about the same as driving a car between 1300 and 2200 miles.
See our E-reserves for articles about LCA for grocery bags, a wind turbine, an office chair, beer, biofuels, and an office building. Most of these are from the International Journal of Life Cycle Assessment. Read/scan at least one of these articles to get an idea of what a real life-cycle assessment is like.
